1.0 INTRODUCTION

This document summarizes the interim remedial measures (IRM) sampling activities conducted at the former Diamond Shamrock Painesville Works Site in November 1997. The IRM activities included sampling of numerous storage vessels and waste piles, fence installation, and plugging of outfalls to Lake Erie. The IRM activities were completed during the Phase I Remedial Investigation at the former Diamond Shamrock Painesville Works Site under the September 27, 1995 Ohio Environmental Protection Agency Director's Final Findings and Orders (DFFO).

1.1 BACKGROUND

On October 3, 1997, representatives from *SECOR* International Incorporated (*SECOR*) and Chemical Land Holdings accompanied the Ohio Environmental Protection Agency (Ohio EPA) during a walk-through of Study Area 2 of the Diamond Shamrock Painesville Works Site (the Site). Historically, Study Area 2 consisted of a coal coking plant and related treatment operations. Diamond Shamrock operated the coke plant from 1924 through 1976, and produced coke for use in Diamond Shamrock operations and for sale to foundries. By-product ovens were used to recover ammonia, gas, and tar distillates from the coal coking process. These by-products were used at other Site processes or sold to outside parties.

Diamond Shamrock sold the coke plant in 1976 to Erie Coke and Chemical Company, which continued coking operations until 1982. The property was sold in 1984 to National GG Industries, which began demolition activities which are not yet complete. However, Scepter Management, as successor to Erie Coke and Chemical Company, was identified in the Ohio EPA's DFFO (item fff. on page 19), "...as the entity ultimately responsible for the shutdown of the Coke Plant operations and demolition of the Coke Plant structures." Many partially-demolished, unsafe structures, some of which still contain process residuals, remain in Study Area 2. The location of Study Area 2 within the Site boundaries is shown on Figure 1.

In a separate DFFO dated May 7, 1996, issued to the current property owner and to Scepter management Corporation, in Section III Ohio EPA stated, quote: "The objectives of Ohio EPA are to: require the proper characterization of all waste on site; to require the removal of all hazardous waste on site; to require the removable friable asbestos on the site; and to prevent harm to human health and the environment." end quote. Insofar as is known, Scepter Management took no action to address these Ohio EPA concerns. Further in this DFFO, Section V. Findings of Facts, Determinations and Conclusions of Law, item E, Ohio EPA stated, quote: "...Erie Coke and Chemical (nka Scepter Management) purchased the property and continued to operate the facility as a coke plant. During their operations on site, iron oxide metal filings and coke tar decanter sludge (K087) were created as waste products. Both the iron oxide filings and the K087 waste were stored on the property for longer than 180 days, resulting in a violation of hazardous waste laws. The company was notified in 1984 that the iron oxide filings were EP toxic for chrome and that the coke tar decanter sludge was a listed hazardous waste. Wastewater from Erie Coke and Chemical contained ammonia, cyanide, phenols, oil and grease. Sludges from their wastewater treatment tested EP toxic for chrome (7.5 mg/l) on 2/8/84." end quote. Later in the DFFO, numerous examples are cited of unsafe conditions, human trespass and/or occupation of the site, and full drums and storage tanks in various states of disrepair (Section V, items F through P).

The walk-through was conducted to identify drums, tanks, vessels, and other structures or storage areas which could potentially release materials to the environment. Seventeen items, or groups of items, were identified during the walk-through. Items identified included various tanks and drums, a gas cylinder, a tar pile, and other miscellaneous storage vessels and structures. Locations of the items identified during

the walk-through are shown on Figure 2. A letter from the Ohio EPA required sampling of the seventeen items listed below for the IRM investigation. The letter is included in Appendix A.

- Item 1: Skid-mounted, rust colored fuel tank;
- Item 2: Stainless steel process tank;
- Item 3: Abandoned semi-truck trailer;
- Item 4: Abandoned water truck;
- Item 5: Black tar pile in front of process building;
- Item 6: Two vertical steel storage tanks on west side of process building;
- Item 7: Process building including a conical tank, two rectifying towers, a still, and a cylindrical tank;
- Item 8: Two scrubbing tower sumps in front of the compressor room;
- Item 9: Two compressor room drums;
- Item 10: Air compressor receiver;
- Item 11: Two large fuel tanks;
- Item 12: Elevated fuel tank;
- Item 13: Drums previously sampled by the Ohio EPA;
- Item 14: Compressed gas cylinder;
- Item 15: Crushed fuel tanks on the east side of former warehouse;
- Item 16: Spherical tank; and
- Item 17: Railroad tank car.

Each of the items listed above were examined as requested by the Ohio EPA and the items containing material were sampled. During the IRM investigation, two additional drums were discovered in Study Area 2, southeast of the former coke ovens. These drums were also examined and sampled.

In addition to drums, tanks and other storage vessels containing materials, the numerous waste piles in Study Area 2 required categorization and sampling. A total of three categories of piles were developed, and composite samples were collected from the piles comprising each category.

In addition to sampling activities, the Ohio EPA required that a security fence be installed at the perimeter of Study Area 2 and that any outfalls to Lake Erie be plugged as part of the IRM activities. These items are summarized in this document as well.

1.2 PURPOSE

The purpose of the IRM sampling activities was to:

- Identify any process vessels, drums, etc., which contain process residuals and characterize those residuals; and
- Identify any waste piles, categorize the piles, and characterize a representative of each category.

The remainder of this document presents the sampling methods used for items identified to contain materials, summarizes the laboratory analytical results, and presents hazardous waste classifications when applicable.

2.0 SAMPLING METHODOLOGIES

This section summarizes the methods used for sampling the interim measures items (e.g., tanks, drums, waste piles). The items determined to be empty during the investigation are also identified. Table 1 summarizes the samples collected and the amounts of waste associated with each sampled item. All of the items investigated are shown on Figure 2. Records for the sampling are included in Appendix B.

2.1 RUSTED FUEL TANK

The skid-mounted, rust colored fuel tank was inspected and determined to be empty. No samples were collected.

2.2 STAINLESS STEEL PROCESS TANK

The stainless steel process tank appeared to be the shell of a former reaction vessel, but the vessel was determined to be empty, and no sampling was required.

2.3 SEMI-TRUCK TRAILER

A backhoe was used to open the door of the semi-truck trailer. The trailer was empty with the exception of some steel carts and miscellaneous debris. No sampling was required.

2.4 WATER TRUCK

The abandoned water truck was determined to be empty after opening the access port on the top of the truck. No sampling was required.

2.5 BLACK TAR PILE

A pile of black, tarry material lies in front of the three-story process building in Study Area 2. The surface of the pile is hard, but the underlying materials are softer and tar-like with notably higher volatile fractions. Some tar flow occurs at the surface of the pile during hot summer days. A backhoe was used to excavate a hole in the center of the pile, since the surface of the pile was too hard to penetrate with a pick-ax, shovel, or hand auger. Use of the backhoe allowed collection of a representative, unweathered sample of the tarry material. A stainless steel scoop was used to collect the material and place it into the appropriate sample containers. It is estimated that approximately 80 cubic yards of the black tarry material are present.

2.6 VERTICAL STEEL STORAGE TANKS

Two thick-walled steel tanks rest on concrete pads on the west side of the three-story process building. Both tanks have a capacity of approximately 10,000 gallons. The pipes that enter the tops of the tanks appear to originate at the first rectifying column that coke gases enter after being pumped from the compressor room. The tanks, therefore, likely contain heavy hydrocarbons which are removed in the first cool-down process for coke gas. These products would primarily consist of compounds with low vapor pressures (naphthalene-range compounds or heavier) which would not be flammable at normal ambient temperatures.

The tanks are vented to the atmosphere through open fittings at the tops, so a photoionization detector was used to monitor vapor concentrations in the tank prior to collecting samples. The monitoring showed that

vapor concentrations were below monitoring equipment detection levels, so sample collection from the tanks proceeded using the methods described below.

2.6.1 North Tank

The north vertical steel tank was inspected from the top using a man-lift, and was sampled using a section of 1-1/2 inch diameter black iron rod. The rod was dropped into the tank and pulled out using a rope that was tied to one end. The tar-like, high-viscosity material found inside the tank adhered to the rod and, upon withdrawal from the tank, the material was slowly transferred to the appropriate sample containers. The north tank contains approximately five cubic yards of the tar-like, high-viscosity material.

2.6.2 South Tank

The south vertical steel tank was also inspected from the top using a man-lift. A black iron rod was used to determine if any material was present inside the tank. However, the material found inside the tank was a hard, solid material which could not be penetrated using the black iron rod. After the level of solids was estimated, a hatch on the side of the tank was removed in order to collect the sample. A shovel was used to break up the material inside the tank to facilitate sample collection. A stainless steel scoop was then used to transfer the solid material to the appropriate sample containers. It is estimated that the south tank contains approximately eight cubic yards of the black process solids.

2.7 PROCESS BUILDING

A three-story process building contained two large rectifying columns, a still, a cylindrical storage tank, and a tank with a conical bottom. A conical bottom tank was also located on the third floor of the building, but was not accessible. Some of the tanks and piping were covered with suspected asbestos insulation that was in poor condition. All inspection and sampling activities conducted in the process building were performed in Level C personal protective equipment, including a respirator with organic vapor and HEPA cartridges.

With the exception of the still, which was empty, all tanks were found to contain materials which required sampling. Each of the tanks are described below.

2.7.1 Conical Tank

The top of the tank with the conical bottom could not be accessed to observe the presence of any liquids. The conical portion of the tank contained an existing sample port and valve. A section of one-inch diameter hose with a secondary containment valve attached to it was connected to the sample port using hose clamps. Once the secondary containment valve mechanism was secure, the conical tank's valve was opened. When liquid began flowing from the tank, the secondary containment valve was opened and the appropriate sample containers were used to collect the liquid.

Since the top of the tank could not be accessed, an estimate of the volume of liquid could not be determined. The total capacity of the conical tank, which is approximately 6,000 gallons, will be used as a conservative estimate of the liquid volume.

2.7.2 Cylindrical Tank

The cylindrical tank, with an approximate volume of 8,000 gallons, located inside the three-story process building also could not be accessed from the top. A port on the side of the tank was used to identify the presence of any material. A tar-like, high-viscosity material was observed in the tank up to the level of the port, which was approximately 3.5 feet from ground level. A sample of the material was collected from a lower valve on the tank and placed into an appropriate sample container. The estimated volume of material is 2,000 gallons.

2.7.3 Rectifying Tower 1

The process building contained two rectifying towers which were likely used to separate various aromatic and polynuclear compounds from coke gas. Both towers appeared to be vented to the atmosphere due to various process piping which had been previously cut from the towers. The towers, therefore, were not under pressure.

Rectifying Tower 1 appears to have been the second rectifying stage of the coke gas process where light oils were recovered for processing. The tower could not be accessed from the top with a man-lift to determine if the tower contained any material. Instead, one of the numerous side ports was opened. The bolts securing the hatch were loosened using a pipe wrench and cheater bar. When opened, a black, granular solid material poured out of the hatch. By the time the hatch was replaced, approximately four cubic feet of the solid material poured out from the tower. The material appeared to consist of heavy hydrocarbon material which had crystallized inside the tower and flaked-off after the coke plant was shut down. A sample of the material was collected, and the remaining material was placed into five-gallon buckets. In order to determine the estimated volume of material inside the tower, additional ports were loosened. The port immediately below the second floor of the building was loosened, and it was determined that the material was present to that level. Higher ports could not be accessed due to health and safety concerns within the building. It is estimated that a minimum of 17 cubic yards of material is present inside the first rectifying tower. The total capacity of the tower is approximately 40 cubic yards.

2.7.4 Rectifying Tower 2

Rectifying Tower 2 was used as the first cool-down and separation stage for the compressed coke gases. The rectifying tower was inspected through one of its numerous side ports. The rusted bolts on the hatches were loosened using a pipe wrench and cheater bar. The section of the tower that was opened contained a bubble-cap column tray with liquid located in the circular dish of the tray. Additional ports were opened and it appeared that one column tray existed per each three-foot section of the tower. A sample of the liquid was collected from the first tray that was opened. The rectifying tower contained ten reflux sections, each containing a bubble-cap tray with approximately one foot of liquid in the dish of the tray. The total estimated volume of liquid in the second rectifying tower is approximately 1,800 gallons.

2.8 SCRUBBING TOWER SUMPS

The remnants of two ammonia scrubbing towers are located in front of the compressor building. Before the coke gas passed through the compressor room, it probably passed through the scrubbing towers for ammonia removal before the gases were sent to the rectifying towers. Ammonia removal is typically performed by scrubbing the gases with a sulfuric acid solution which converts ammonia gas to dissolved ammonium sulfate salts. The bottom of the east tower sump is filled with rain water, which was sampled using an extension rod with an attached sample jar. The west tower sump was sampled through a small

opening to the atmosphere also using an extension rod with an attached sample jar. It is estimated that approximately 750 gallons of water are present in each sump.

2.9 COMPRESSOR ROOM DRUM

One of the two compressor room drums contained approximately 40 gallons of material which appeared to be lubricating oil. A sample of the viscous material was collected using a sampling rod. The material adhered to the rod, and once withdrawn from the drum, the material was transferred into the appropriate sample containers. The second drum was determined to be empty and sampling was not required.

2.10 AIR COMPRESSOR RECEIVER

The air compressor receiver was determined to be empty, and therefore, a sample was not collected.

2.11 TWO LARGE FUEL TANKS

Both fuel tanks were determined to be empty, and sampling was therefore not required.

2.12 ELEVATED FUEL TANK

A man-lift was used to access the elevated fuel tank for inspection. The tank was determined to be empty, and no sampling was required.

2.13 DRUMS PREVIOUSLY SAMPLED BY OHIO EPA

Two drums located in Study Area 2 were previously identified and sampled by the Ohio EPA. The drums were not resampled during the interim measures sampling activities. The drums were, however, examined and it was noted that each of the drums contained approximately 25 gallons of liquid.

2.14 COMPRESSED GAS CYLINDER

The compressed gas cylinder was determined to be empty.

2.15 CRUSHED FUEL TANKS

The crushed fuel tanks located on the east side of the former warehouse were determined to be empty, and no sampling was required.

2.16 RAILROAD TANK CAR

An abandoned railroad tank car is located in the south portion of Study Area 2. A valve at the top of the rail car was open and the lid to the tank was not bolted or sealed. A preliminary view of the interior of the rail car was performed by partially opening the rail car lid. This preliminary view suggested that the rail car may contain 500 to 1,500 gallons of liquid with a phenolic odor. A PID reading of 300 ppm was observed when the PID wand was placed into the opening of the tank. Sampling activities for the rail car were completed in Level C personal protective equipment.

An OSHA-approved ladder was used to access the platform on the top of the tank. The liquid sample was collected through the lid on the top of the tank using a sample jar which was connected to an extension rod.

After the sample was collected, the depth of liquid was estimated. Approximately one foot of liquid was present in the tank, for a total volume of approximately 1,400 gallons. In addition, approximately eight inches of a dense tar-like material (approximately two cubic yards) was present at the bottom of the tank. The tank lid was secured with chains and locked shut upon completion of all sampling activities.

2.17 GAS SPHERE

A spherical gas storage tank is located on the east side of Study Area 2. Purified coke gases were likely sent to this tank from storage before they were used as fuel. Condensate that formed in the tank was drained through a bottom valve. The spherical tank is currently vented through open valves and is not under pressure. Although the tank does not contain gas, residual condensate with potential dissolved aromatic hydrocarbons was expected to be present in the bottom of the tank.

The condensate drain valve and associated piping are very corroded, and the valve no longer has a valve stem handle to open and close the valve. In addition, the valve is difficult to reach safely since it is located over a sump filled with water. The tank inspection and sampling, therefore, were conducted through an open 12-inch valve in the side of the tank. An OSHA-approved ladder was used to access the open valve. The sample was collected using a sampling jar attached to a plumb-bob device strung through a loop at the end of an extension pole. The depth to condensate was estimated using water finder with the plumb-bob device. The depth to liquid was approximately 5.5 feet, resulting in 4.5 feet of liquid in the bottom of the spherical tank. The volume of liquid present in the 490,000 gallon-capacity sphere is approximately 11,200 gallons.

2.18 RUSTED DRUM

During waste pile sampling activities, a rusted drum was identified to the southeast of the former coke ovens in Study Area 2. The drum was sealed but evidence of corrosion was visible. In order to inspect the contents of the drum, a screw cap on the top of the drum was broken off. The rusted drum contained both a solid material and a liquid. The drum was tipped on its side in order to collect a sample of the opaque, odorless, viscous liquid. The remaining liquid was transferred to a new polyethylene tight-head drum for proper storage. Approximately 12 gallons of liquid were transferred to the storage drum.

In addition to the viscous liquid, a white, solid, salt-like material was present inside the drum. A pick-ax was used to create a larger opening on the top of the rusted drum in order to collect a sample of the solid material. A stainless steel scoop was used to transfer pieces of the white solid from the drum to the appropriate sample containers. The rusted drum was approximately half-full of the solid material (3.5 cubic feet). After sealing the rusted drum, both drums were placed inside the nearest building.

2.19 MOTOR OIL DRUM

A second drum was discovered near the rusted drum, southeast of the former coke ovens. The second drum was labeled as motor oil. The bung on the top of the drum was opened and the drum was tipped on its side to collect a sample of the liquid, which did resemble motor oil. Approximately five gallons of oil remain in the drum.

2.20 WASTE PILES

Numerous waste piles are present in Study Area 2. A total of 91 waste piles were identified (Figure 2), sampled, and categorized during IRM inspection and sampling activities. In order to adequately

characterize the waste piles, composite samples were obtained from each pile. A pick-ax was used to loosen the material at five locations within each pile, and the waste pile material was placed into a Ziploc bag with a stainless steel scoop.

After each waste pile composite sample was collected, each sample was thoroughly examined for categorization. The majority of the samples collected fell into Category 1, consisting of black, silty fine to medium sand-like material, with traces of gravel, brick, and other debris. Category 1 piles were also noncohesive, odorless, and dry. In addition, Category 1 piles were rich in organic soil. Approximately 4,400 cubic yards of Category 1 piles are present in Study Area 2.

One pile fell into a second category containing a black, coarse, angular sand-size material, similar to pulverized coal. The material was well-sorted and contained a trace of fine material. This material was also noncohesive, odorless, and dry. This Category 2 pile is approximately 33 cubic yards in size.

The third and final category of waste piles also consisted of only one pile. This pile consisted of a very fine, black, silty material. The pile contained some red, light brown, and tan fines, as well. The material in this Category 3 pile was somewhat cohesive, and slightly moist. The Category 3 pile is approximately 96 cubic yards in size.

3.0 SUMMARY OF ANALYTICAL DATA

Many of the tanks and vessels that were investigated in Study Area 2 were empty, and did not require sampling. The items that contained materials which were sampled are presented below:

- Black tar pile in front of process building;
- Two vertical steel storage tanks on west side of process building;
- Process building, including a conical tank, two rectifying towers and a cylindrical tank;
- Two scrubbing tower sumps in front of the compressor room;
- One of two compressor room drums;
- Drums previously sampled by the Ohio EPA;
- Spherical tank;
- Railroad tank car;
- Rusted drum; and
- Motor oil drum.

Samples were also collected from three waste pile categories in addition to the samples listed above.

The laboratory analytical data for the interim measures samples have been imported electronically into the Painesville Works Site Electronic Database. In order to minimize redundancy, this submittal provides database tables in Appendix C for the interim measures analytical results rather than hard copy analytical reports.

The database tables in Appendix C include a column ("Qual") for laboratory qualifiers. To assist in the review of the laboratory analytical results, descriptions of the qualifiers associated with the interim measures data are presented below. The following is a list of descriptions for the qualifiers used for the organic analytes:

- B Analyte was detected in the associated method blank;
- C Pesticide result was confirmed with gas chromatography/mass spectrometry;
- D Compound was quantitated on a diluted sample;
- E Concentration exceeded the calibration range of the instrument;
- J Result is an estimated value (between the method detection limit and the Ohio EPA-approved limit of quantitation);
- P Concentration difference between primary and confirmation columns was greater than 25 percent;
- U Compound was not detected; and
- X The analytical result is discussed in the case narrative.

The following list provides descriptions for the inorganic data qualifiers:

- B Value is less than the contract-required detection limit, but greater than or equal to the instrument detection limit;
- E Value is estimated due to interference;
- N Spike sample not within control limits; and
- * Duplicate analysis not within control limits.

Organic constituents detected by the laboratory instrument and represented as peaks on the chromatograms for the volatile and semi-volatile analyses are reported. In addition to the compounds specified for analysis,

the laboratory identifies the 30 highest peaks, and considers these analytes tentatively identified compounds (TICs). Since the analytical results for these compounds are estimated, each of the results include a "J" qualifier.

The remainder of this section summarizes the analytical results obtained for each sample, and presents the waste classification when appropriate.

3.1 BLACK TAR PILE

The black tar pile sample (BTP) was analyzed for Phase I Remedial Investigation (Phase I RI) analytical parameters:

- Target Compound List (TCL) volatile organic compounds (VOCs),
- TCL semi-volatile organic compounds (SVOCs),
- Target Analyte List (TAL) metals, which include cyanide,
- Hexavalent chromium,
- Total organic carbon (TOC), and
- TCL pesticides/polychlorinated biphenyls (PCBs).

In addition to the Phase I RI parameters, the sample was analyzed for Toxicity Characteristic Leaching Procedure (TCLP) VOCs and TCLP metals for waste characterization purposes. The TCLP analytical results indicate that the black tar pile exhibits the characteristic of toxicity for benzene. Table 2 shows that the black tar pile sample contained 3.1 mg/l of benzene in the TCLP extract, which is greater than the regulatory level of 0.5 mg/l. The black tar pile material is, therefore, classified as a hazardous waste with United States Environmental Protection Agency (USEPA) Hazardous Waste Number D018.

3.2 WASTE PILES

Each of the waste pile samples were analyzed for the Phase I RI parameters and asbestos. The waste pile samples were also analyzed for TCLP VOCs and TCLP metals for waste characterization purposes. The TCLP analytical results indicate that the waste pile materials (all three categories) are not hazardous based on the characteristic of toxicity. The sample analytical results were compared to USEPA Region IX Residential Preliminary Remediation Goals (PRGs). The results of the comparisons are discussed below.

3.2.1 Category 1 Piles

The following constituents were detected in sample WP1/2 at concentrations in excess of Region IX Residential PRGs:

- Aroclor-1260
- Arsenic
- Benzo(b)fluoranthene
- Beryllium
- Chromium
- Chrysene

Of the constituents listed, arsenic and beryllium were the only constituents detected at concentrations greater than the laboratory limit of quantitation (LOQ). The LOQ is the minimum concentration of a substance that can be reproducibly quantified at a given level of confidence. It is dependent upon the

sample matrix, instrument capability, and method of detection. The concentrations for the four remaining constituents were estimated between the method detection limit (MDL) and the LOQ. The MDL is the minimum concentration of substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. Please note that the Region IX Residential PRGs for all of the listed constituents, except chromium, were equal to or below the MDL.

3.2.2 Category 2 Piles

The following constituents were detected in sample WP3 at concentrations in excess of Region IX Residential PRGs:

- Arsenic
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(b)fluoranthene
- Beryllium
- Indeno(1,2,3-cd)pyrene

All of the constituents, with the exception of arsenic, were estimated between the MDLs and the LOQs. The Region IX Residential PRGs were below the MDLs for each constituent listed above, with the exception of beryllium. The Region IX Residential PRG for beryllium was, however, less than the LOQ.

3.2.3 Category 3 Piles

The results for the sample (WP4) collected from the third category of waste piles indicate that the following constituents are present in excess of the Region IX Residential PRGs:

- Arsenic
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(b)fluoranthene
- Chromium
- Chrysene
- Dibenzo(a,h)anthracene
- Heptachlor epoxide
- Indeno(1,2,3-cd)pyrene
- Lead

Please note that the Region IX Residential PRGs are below MDLs for arsenic, benzo(a)anthracene, and benzo(b)fluoranthene, and are below the LOQs for benzo(a)pyrene, chrysene, dibenzo(a,h)anthracene, and heptachlor epoxide.

3.3 VERTICAL STEEL STORAGE TANKS

The samples collected from the two vertical steel storage tanks were analyzed for the Phase I RI parameters. The north tank (PBVT1), however, was not analyzed for TOC or asbestos due to its sample matrix. Both samples were also analyzed for TCLP VOCs and TCLP metals. The TCLP analytical results for both PBVT1 and the south vertical tank sample (PBVT2) indicate that the materials do not exhibit the characteristic of toxicity.

However, the pipes leading to the vertical tanks originate from Rectifying Tower 2 in the process building and indicate that the two vertical steel storage tanks contain residuals from the coke gas refining process. These tanks were likely used for naphthalene separation, and therefore, the materials are listed wastes with USEPA Hazardous Waste Number K145. Wastes classified as K145 hazardous wastes are described as "residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal." The hazardous constituents for which the waste is listed are: benzene, benzo(a)anthracene, benzo(a)pyrene, chrysene, dibenzo(a,h)anthracene, and naphthalene.

The analytical results included in Appendix C for the two vertical storage tank samples indicate that naphthalene was detected in both samples at concentrations greater than the instrument calibration range, and dilution was required to quantify the concentration. Benzene was detected in the sample collected from the first vertical storage tank. Benzo(a)anthracene and chrysene were detected in each sample at estimated concentrations between the MDL and LOQ.

3.4 PROCESS BUILDING

3.4.1 Conical Tank

The conical tank sample (PBCT) was analyzed for the Phase I RI parameters. The analytical results do not indicate that the liquid is hazardous based on the toxicity characteristic. The conical tank was likely used as a decanter tank for light oils obtained from Rectifying Tower 1. Any light oil residuals in the decanter tank would be classified as a K143 waste. A K143 waste is described as "process residues from the recovery of light oil, including, but not limited to, those generated in stills, decanters, and wash oil recovery units from the recovery of coke by-products produced from coal." However, the waste classification does not extend to waste water from the decanter since the USEPA has determined that waste water from the decanter is adequately regulated under the toxicity characteristic rule and the Clean Water Act. Because the water in the decanter tank is not hazardous under the toxicity characteristic rule, it may be discharged to a publicly owned treatment works (POTW) or industrial water treatment facility regulated under Section 402 or 307(b) of the Clean Water Act.

3.4.2 Cylindrical Tank

The cylindrical tank sample (PBCT2) was analyzed for TCLP VOCs and TCLP metals in addition to the Phase I RI parameters. This sample was not analyzed for TOC or asbestos due to its matrix. The TCLP analytical results indicate that the cylindrical tank material exhibits the characteristic of toxicity for benzene. The analytical result, in excess of the regulatory level, is shown on Table 2. This material is classified with USEPA Hazardous Waste Number D018.

Piping from Rectifying Tower 2 to the cylindrical tank indicates that the tar-like contents are residuals from naphthalene-range product collected at the first cool-down coke gas refining process. This indicates that the material is classified as a K145 listed hazardous waste. As stated previously, wastes classified as K145 hazardous wastes are described as "residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal." The high concentrations of naphthalene in the waste material suggest that this waste classification is correct. The hazardous constituents for which a K145 waste is listed are: benzene, benzo(a)anthracene, benzo(a)pyrene, chrysene, dibenzo(a,h)anthracene, and naphthalene.

Of the constituents for which the waste is listed, the following were detected in the sample collected from the cylindrical tank: benzene, dibenzo(a,h)anthracene, and naphthalene. Naphthalene was present at a level

greater than the instrument calibration range, and its concentration was quantified on a diluted sample. Benzo(a)anthracene, benzo(a)pyrene, and chrysene were detected at estimated concentrations between the MDL and LOQ.

3.4.3 Rectifying Tower 1

The sample collected from Rectifying Tower 1 (PBT1) was analyzed for the Phase I RI parameters and asbestos. The sample was also analyzed for TCLP VOCs and TCLP metals for waste characterization purposes. The analytical results for the TCLP analyses indicate that the material inside the first rectifying tower is hazardous for benzene based on the toxicity characteristic. The analytical result is shown on Table 2. This material is classified as a D018 waste.

In addition to classification as a hazardous waste based upon the toxicity characteristic, the material inside the tower is also classified as a listed hazardous waste with USEPA Hazardous Waste Number K143. Piping associated with this rectifying tower indicates that it was likely used as a light oil scrubber for coke oven gas. The residuals from the light oil scrubber are classified as K143 wastes and are described as "process residues from the recovery of light oil, including, but not limited to, those generated in stills, decanters, and wash oil recovery units from the recovery of coke by-products produced from coal."

K143 wastes are listed for the following constituents: benzene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, and chrysene. Of these constituents, benzene was detected in the first rectifying tower sample.

3.4.4 Rectifying Tower 2

The water sample from Rectifying Tower 2 (PBT2) was analyzed for the Phase I RI parameters. The analytical results indicate that the waste water inside the second rectifying tower is not hazardous based on the toxicity characteristic. The water can be discharged to an industrial water treatment facility, providing that the treatment facility is regulated under Section 402 or 307(b) of the Clean Water Act.

3.5 SCRUBBING TOWER SUMPS

The two scrubbing tower sump samples (ST1 and ST2) were analyzed for the Phase I RI parameters. The analytical results do not indicate that the water in either of the sumps is hazardous based upon the toxicity characteristic. The water inside the sumps appears to be rain water and is not classified as a listed hazardous waste.

3.6 COMPRESSOR ROOM DRUM

A hydrocarbon fingerprint analysis was conducted on the sample (CRD1) collected from the compressor room drum. The analytical results indicate that the molecular weight of the material is approximately 12 carbon chains higher than 10W40 motor oil. This corresponds to the expected molecular weight range for a typical lubricating oil. The material inside the drum is not considered a hazardous waste. The hard copy analytical report for CRD1 is included in Appendix C.

3.7 RAILROAD TANK CAR

The railroad tank car sample (RC2-1) was analyzed for the Phase I RI parameters. The analytical results indicate that the water inside the railroad tank car is not a hazardous waste based upon the toxicity

characteristic. The water does contain cyanide at a concentration of 82.3 mg/l, as well as dissolved polynuclear aromatic (PNA) compounds. Due to the cyanide and PNA concentrations, the water must be disposed of at an industrial water treatment facility.

3.8 GAS SPHERE

The gas sphere sample (GB2-1) was analyzed for the Phase I RI list of parameters. The analytical results for the gas sphere sample indicate that the liquid exhibits the toxicity characteristic for benzene. The analytical result (50 mg/l) is shown on Table 2. The gas sphere liquid is classified as a hazardous waste with USEPA Hazardous Waste Number D018. A significant amount of cyanide (25.5 mg/l) was also detected in the gas sphere sample.

3.9 RUSTED DRUM

The rusted drum appeared to contain a water treatment salt, possibly used for boiler water treatment. Both solid and liquid samples collected from the drum were, therefore, analyzed for TCL VOCs, TCL SVOCs and total phosphorus. A cation and anion scan was also performed on the samples collected from the rusted drum. The analytical results indicate that the liquid is an approximately 10 percent sodium-based salt solution. The solids in the drum are likely salts which precipitated from the solution. The pH of the sample, 12.3 (shown on the sampling form in Appendix B), indicates that the material is a weak base, possibly sodium aluminate, which is used as a flocculent for boiler water feed systems. The materials in the drum are not hazardous wastes.

3.10 MOTOR OIL DRUM

A hydrocarbon fingerprint analysis was conducted on the motor oil drum sample (D2). The result of the hydrocarbon fingerprint indicates that the material has a molecular weight approximately four carbon chains higher than 10W40 motor oil. The material is not classified as a hazardous waste. The hard copy analytical report is included in Appendix C.

3.11 DRUMS PREVIOUSLY SAMPLED BY OHIO EPA

The drums previously sampled by the Ohio EPA were analyzed for VOCs, SVOCs, pesticides and PCBs, TCLP metals, TCLP VOCs, and TCLP SVOCs. Flash points for the drum contents were also determined. The flash point for each of the drum samples (DS01 and DS02) are 142 and 144 degrees Fahrenheit, respectively. Since the flash points are greater than 140 degrees Fahrenheit, the contents are not classified as D001 hazardous waste (waste that exhibits the combustible characteristic).

One of the drums (DS02), however, contains lead at a concentration of 112 mg/l, which is greater than the USEPA maximum concentration for the toxicity characteristic for lead (5 mg/l). The liquid inside this drum, therefore, is classified as hazardous waste, based upon the toxicity characteristic, with USEPA Hazardous Waste Number D008.

4.0 MISCELLANEOUS IRM ACTIONS

In addition to investigation and sampling (if appropriate) of the 17 items and waste piles identified during the Study Area 2 walk-through, the Ohio EPA required that a security fence be installed at the perimeter of Study Area 2 and that all outfalls, or open pipes, to Lake Erie be plugged. This section summarizes these IRM actions.

4.1 SECURITY FENCE INSTALLATION

A eight-foot high chain-link fence was installed at the perimeter of the former coke plant. Installation of the security fence was completed in February 1998. The fencing was installed in order to prevent trespassers from entering the property and potentially encountering hazardous and non-hazardous waste materials. The location of the security fence is shown on Figure 2.

4.2 PLUGGING OF OUTFALLS

As part of the IRM activities, the Ohio EPA required that any outfalls, or open pipes, to Lake Erie be plugged. On October 28, 1997 an Ohio EPA representative assisted Chemical Land Holdings and SECOR with the identification of open pipes to Lake Erie.

Four open pipes were identified at Outfall Location 1, on the east end of the Study Area 2 shoreline, immediately west of the One Acre Landfill. At this location, shown on Figure 2, one two-inch, one ten-inch, and two six-inch diameter pipes were identified and plugged.

At Outfall Location 2, near the empty fuel tanks labeled as Item 11, one three-inch and three two-inch diameter pipes were identified. After further investigation, one two-inch diameter pipe was found to be an electrical conduit and one two-inch diameter pipe was loose. These pipes did not require plugging. The remaining pipes were plugged.

One three-inch diameter pipe was identified at Outfall Location 3, at the west end of the Study Area 2 shoreline. Further investigation indicated that this pipe was filled with gravel and was loose. This pipe, therefore, did not require plugging.

Please note that no flow was observed from any of the pipes prior to plugging. All plugs were made using expandable seal caps.

5.0 CONCLUSIONS

A walk-through of Study Area 2 of the Site in October 1997 resulted in identification of 17 items which required investigation and sampling. The 17 items consisted of tanks, drums, and miscellaneous storage vessels or areas within the former coke plant. Waste piles located throughout Study Area 2 also required sampling. In addition to sampling items containing materials, Ohio EPA required that any outfalls (or pipes) to Lake Erie be plugged and that a security fence be placed around the perimeter of Study Area 2 to prevent trespassers from entering the property.

A total of 14 storage vessels or areas required sampling during the IRM investigation. In addition, three categories of waste piles were also sampled. Table 3 summarizes each of the sampled items by presenting volumes and waste classifications. Please note that the drums previously sampled by Ohio EPA are also summarized in Table 3.

In addition to sampling and waste classification, a fence was installed at the perimeter of Study Area 2 and a total of six pipes open to Lake Erie were plugged. The IRM activities conducted during the Phase I RI meet the requirements set forth by the Ohio EPA in a letter dated October 22, 1997 (presented in Appendix A).

**Re: Diamond Shamrock
Painesville Work Site Coke
Plant Property/Interim
Action**

Mr. Paul Dugas
Painesville PRP Group
c/o Chemical Land Holdings, Inc.
Midland Building, Suite 207
P.O. Box 1487
Painesville, OH 44077-0031

Dear Mr. Dugas:

As we have discussed, the Ohio EPA is greatly concerned that interim action work that we believe to-be necessary at the coke plant portion of the Diamond Shamrock Painesville Works Site has never been performed. Although the Agency issued unilateral interim action orders to Ace Lakefront Properties ("Ace"), and Scepter Management Corporation ("Scepter"), Ace is, as of this date, in complete non-compliance with the orders and Scepter has delayed any performance by invoking the appeals process. Unfortunately, conditions at the coke plant portion of the Site, known as Study Area 2, continue to constitute a substantial threat to human health and the environment.

Specifically, hazardous waste has been illegally disposed of at the coke plant property, and other hazardous materials are present, with virtually no containment or restrictions on access. Numerous examples of human occupation and/or trespass have been observed on the property, including the placement of furniture in various locations, alcohol and soft drink containers disposed of on the property, and articles of clothing found on the property. We also believe that the Remedial Investigation will be hindered by the current conditions at the coke plant property, in so far as the uncontained waste and debris may make full characterization of the property difficult.

Mr. Paul Dugas
October 22, 1997
Page 2

In order to avoid any further exposure or potential exposure to the hazardous waste on site, and to facilitate the RI/FS, the Ohio EPA is requesting the Painesville PRP Group perform the minimum interim action necessary to secure Study Area 2. To that end, we are invoking Paragraph 12.g. of the Administrative Orders on Consent, and we request the following work be performed:

INTERIM REMEDIAL MEASURES - STUDY AREA 2

- 1.) Secure the entire property by fencing to prevent trespasser access. Place warning signs on the fence and along the shoreline. Inspect the fence regularly to ensure integrity.
- 2.) Visually locate and categorize all discrete, significant waste piles on Site. Collect sample per category (RCRA composite). Estimated number of categories - 4 to 6.
- 3.) Visually locate, sample, and dispose of or properly store all drums containing materials that could potentially be released to the environment.
- 4.) Visually locate and sample all tanks containing materials that could potentially be released to the environment (as per the RI/FS order). Tanks which contain oils or hazardous substances which may be released to the environment should be inspected for integrity and measures to ensure that release does not occur shall be taken (as approved by the Ohio EPA).
- 5.) Visually locate and plug all outfalls to Lake Erie (as approved by the Ohio EPA). Estimated number of outfalls on Site - 4.

Please be advised that this request does not obviate the need for the removal measures described in the unilateral order of the director issued to Ace and Scepter; it merely addresses the circumstances which made such removal work immediately necessary. Further, nothing in this request releases any party, including the Painesville PRP Group, Scepter, or Ace from any further removal or remedial work necessary at the Diamond Shamrock Painesville Works Site, nor does it relieve any party not performing the work from any liability it may have with regard to the work.

In accordance with Paragraph 12.g., we will expect a response from the Painesville PRP Group within thirty (30) days of the date of this letter indicating their willingness to perform this work. In the event that the Painesville PRP Group declines to perform these interim measures, the Ohio Environmental Protection Agency will consider other enforcement options.

Mr. Paul Dugas
October 22, 1997

CR01 Grab Liquid Sample

Painesville, OH Phase 1 RI/FS

Analysis: 2012

The GC Fingerprint for this sample is an area of unresolved peaks typical of our lubricating oil reference standards. The sample pattern elutes approximately 12 carbon chain length equivalents later than our 10 W 40 motor oil reference pattern (our latest eluting reference standard) and may be due to a heavier weight lubricating oil fraction.
